

Getting Started with Visual Studio

27 Jun 2022

Observations:

1. There are Four (4) main elements that make up the HTML structure, namely: `<!DOCTYPE>`, `<html></html>`, `<head></head>` and `<body></body>`. Note: The forward slash(/) signifies a closing tag for container tags.
2. The heading tags represented by `h1`, `h2`, `h3`...`h6` define the size of the text inside the container tags. The higher the number, the smaller the text. The texts are preformatted in bold state.
3. Elements inside the `<body>` and `</body>` are displayed in the output when the code is ran except for the comment inside the `<!--.....-->` tag.
4. In unordered list ` `, html simply puts a bullet in front of the items in the list. Alternately, using ordered list ` `, html will automatically assign a serial number to each item in the list.
